

Lead Service Line Inventory

In 2021 the State of New Jersey enacted law A5343 which requires all public water community systems to inventory and replace lead service lines within 10 years. Water providers are to share with consumers the material of the utility owned portion, the customer side portion and identify them by 2031. Lead services now include galvanized services. To maintain a proper inventory, we need customer assistance in identifying the material of the water pipe servicing your home/property. Customers with known lead and galvanized services and unknown materials will be receiving a letter from the MUA.

There are two ways to complete this process and for the Monroe MUA to properly identify the material:

- Take a picture of your water service coming through the foundation of your property going to your water meter and email it to us; or
- Call our office and one of our representatives can come out and confirm the material

If the service to the property is confirmed to be lead or galvanized the Monroe MUA would like to work with you to replace the service at no direct cost to you. As our plan is beginning there is no timetable for replacement. We need to confirm the material before replacement begins.

Meeting and exceeding the drinking water standards is the top priority of the Monroe MUA and developing and launching our Lead Service Line Replacement Program is the next step in the process. Your water meets all NJDEP water quality standards as we treat for corrosion control and our lead and copper compliance testing continues to meet state drinking water requirements.
